

**Amendments to the Specification:**

Replace paragraph [0048] with the following amended paragraph:

**[0048]** With respect to all the embodiments shown thus far, the axle has been illustrated as a single contiguous longitudinal member. In an alternate embodiment, however, the axle includes a first axle segment 608a coupled to the fan head and a second axle segment 608b coupled to the pump head, wherein the first and second axle segments are mechanically coupled via a gearing mechanism 609, e.g., one or more gears (as shown on FIGs. 6 and 8), linkages, or other such mechanical couplings. The use of separate axles is advantageous in that the speed and power of the pump may be tailored for the strength of the motor.
